Ahol: This cDNA library was constructed from mRNA isolated from cotyledons of 3- and 7-day-old Williams seedlings which were propagated on paper towels with distilled water. The cotyledons were flash-frozen in liquid nitrogen, then lyophilized for 72 hours. Unequal amounts of mRNA was used for CDNA synthesis. Stratagene's CDNA Synthesize the CDNA. First- stranded synthesis was performed with 5-methyl dCTP, hence the ligated CDNA was lemimethylated. A modification of Stratagene's first- stranded synthesis was performed with 5-methyl dCTP, hence the ligated CDNA was first-print.

This invention describes a novel protein (I) with the activity of wheat starch synthase. Transgenic plants, specifically wheat, that contain (I) are used for production of starch, used particularly in foods, particularly baked and pastry goods and for making packaging materials or disposable items. Starch may also be used as starting materials for clusposable items. Starch may also be used as starting materials for glucose or glucan components (e.g. for fermentation or further chemical conversion); in paper and pulp production, as adhesives, in textiles, in preparation of gypsum-based building materials, as soil stabilizer, as wetting agent etc. in fertilizer and plant-protection compositions, as binder (in pharmaceuticals, cosmetics, coal briquetting and casting sand), as floculant in soil or coal slurries, as rubber and leather canditives, and for production of synthetic polymers, e.g. polyurethane films. Transgenic plants with increased/decreased production of (I) amylose/amylopectin ratios, degree of branching, mean chain length, phosphate content, gelatinization properties, gel- or film-forming properties, or starch grain size or structure. This sequence encodes the plant, inc.

The invention relates to a novel enzyme of starch biosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (SBE) I, SBE II, starch soluble synthase (SSS) I, and debranching enzyme (DBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of rice or maize. The methods and products can be used for plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low moi. wt. glutenin, grain softness protein I, bacterial isoamylase, can be used for modifying the characteristics of starch produced by a method of the contract of the second of the second of the second of the characteristics of starch produced by a
 plant. The present sequence represents the wheat SSS I cDNA sequence.

```
This near full-length cDNA clone, designated TaSSS, codes for a soluble starch synthase (see AAW23837) of summer wheat (cv. Florida).

It was isolated from a phage cDNA library of 21-day-old wheat caryopses by screening with a PGER fragment derived from rice soluble starch synthase (see also AAV01529-30). A second clone (see AAV01528), coding for wheat granule-bound starch synthase (see AAW2938) is also claimed. These isolated nucleic acids can be inserted into vectors for production of transgenic plants, particularly starch-producing plants, specifically wheat. Use of the isolated nucleic acids, or claimed. These isolated nucleic metabolism to be regulated in transgenic plants. Overexpression may result in improved crop yield, while modification of starch in planta may eliminate the altered levels of the various isoforms of starch synthase will altered levels of the various isoforms of starch synthase will produce starch of different chain length, amylose/amylopectin ratio, degree of branching, phosphate content, gelatinisation behaviour, granule size and shape, viscosity etc. The starch produced by such plants is useful particularly in foods or to produce packaging earliers.
 Nucleic acid encoding starch synthase enzymes from wheat - for transgenic plants that produce modified forms of starch, useful e.g. in foods, or for production of packaging materials and disposable

The present sequence is the corn soluble starch synthase (SSI) composite gene. This was used in the construction of plasmid pSSII for the generation of an antisense construct for suppression of SI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose
 Producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct
 Soluble starch synthase; starch fine structure; corn; transgenic plant; amylose; amylopectin; amylose polymerisation; non-granule bound starch synthase; non-GBSSI; altered starch; f

The soluble rice starch synthetic enzyme gene has, at the N-terminal, the transit peptide that is required for the transition of this enzyme to the amyloplast. Introduction of this gene into the rice protoplast augments the expression of soluble rice starch synthetic enzyme. The transit peptide coding sequence can be used for the efficient transition of any protein into amyloplasts. Soluble rice starch synthetic enzyme gene and transit peptide for the efficient transport of heterologous proteins to amyloplast 91 ProAspAlaGlyValGlyGluLeuAlaProAspLeuLeuLeuGluGlyIl 107 174 .....AGGT 186 233 271 321 126 ececeancesearcesecesecerecreseceseceseceseces 20 65 92 17 uargalaaspProalaThralaalaargalaSeralaCysValValArgA 51 GluGlyProAlaAlaArgProAlaGlnGlnGlnGlnLeuAlaPro.... .....ProLeuValProGlyPheLeuAlaPro.....ProP Sequence 2533 BP; 630 A; 550 C; 701 G; 652 T; 0 other; Length: 726 Gaps: 18 Percent Identity: 76.309 (MITS-) MITSUI GYOSAI SHOKUBUTSU BIO KENKYUSHO to: 2533 Claim 1; Page 15-17; 18pp; Japanese. from: 1 92JP-0179947 /\*tag= d 1992..2533 /\*tag= e 92JP-0179947 /\*tag= c 453..1991 114..1994 /\*tag= b 114..452 Quality: 2821.50 Ratio: 4.522 nilarity: 85.950 Align seg 1/1 to: AAQ45183 US-09-674-824-2 x AAQ45183 WPI; 1994-128678/16.  The present sequence encodes maize starch synthase type I, useful in the production of starch. Starch can be used in various conventional starch applications, e.g. starch hydrolysate products, foods, papermaking, adhesives, textiles, building materials, soil stabilisation, agrochemicals, pharmaceuticals, cosmetics, coal briquettes, ore and coal slurries, foundry casting, rubber, leather and synthetic polymers. The enzyme produces a starch stated to have different physicochemical properties, especially viscosity and gelling properties, from wild type starch.

```
starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics

The sequence is that of the soluble starch synthase I gene. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating the payload protein in starch, it is more resistant to degradation by stomach acids.
 t
protein - useful for, e.g. producing protein(s) resistant degradation by stomach acids

The specification describes a method for the production of non-glycogen-like polysaccharides in a host. The method comprises transforming a host, suitable for fermentation, with genes encoding starch- or glycogen-synthesis enzymes, and fermenting the transformants. The specification also describes hosts transformed with a gene active in glycogen synthesis and at least one non-starch branching gene,
 Non-glycogen-like polysaccharide production; fermentation; starch synthesis enzyme; glycogen-synthesis enzyme; glycogen synthesis; non-starch branching gene; amylopectin; amylose; plant-like starch; maize starch soluble synthase I-2; ss.
 Producing non-glycogen-like polysaccharides in bacteria, fungl or plants - transformed with genes for enzymes involved in starch or glycogen synthesis allows fermentative production of starches with

cDNA clones SSS10.52, SSS6.31 and SSS56 (AAT67285-87) code for maize soluble starch synthase (SSS). They were isolated from a maize inbred line W64A library by screening with a probe (AAT67288) based on pea SSS, rice SSS and maize GBSS. The cDNAs can be used to produce plants with an increased capacity for producing starch, or a capacity to produce starch with an altered fine structure. They can also be used to isolate the corresponding genomic sequences from crop plants, to determine the contribution of the SSS gene to the net regulation of starch blosynthesis, and to modify the levels of starch produced by the plant. Transgenic plants (esp. maize) can be used to produce hybid plants which have higher rates of starch synthesis at temperatures above the normal optimum.
 Soluble starch synthase; SSS10.52; transgenic plant; cereal; maize;
 cDNA encoding soluble starch synthase - used to produce transgenic plants with increased capacity for producing and storing starch

The present sequence represents an isolated nucleic acid molecule which has been isolated and comprises a nucleotide sequence encoding a polypeptide having soluble starch synthase (SSS) activity, where the polypeptide is encoded by a maize gene. The isolated nucleic acid molecule can be used to produce transgenic plants with altered starch production. The transgenic plants produced using the nucleic acid molecule have an enhanced ability to produce structurally-altered starch. maize gene starch synthase activity, where polypeptide is encoded by 7.1 663 ceccerceccacceecccccc.....ceaagecrccaec AlaArgProAlaGlnGlnGlnGlnLeuAlaProProLeuValProGlyPh roProLeuProAspAlaGlyValGlyGluLeuAlaProAspLeuLeuLeu GAAGGGATTGCTGAAGGTTCCATCGATAACACAGTAGTTGTGGCAAGTGA uGlnAspSerGluIleMetAspAlaAsnGluGlnProGlnAlaLysValT hrArgSerIleValPheValThrGlyGluAlaAlaPro.TyrAlaLysSe AspLysAsnTyrAlaLysAlaLeuTyrThrAlaLysHisIleLysIlePr eLeuAlaProProProAlaProAlaGlnSerProAlaProThrGlnP 6 ValGlyAlaGlyCysLeuAlaProSerValArgLeuArgAlaAspProAl 22 aThralaala...argalaSeralaCysValValargAlaArgLeuArgA rgLeuAlaArgGlyArgTyrValAlaGluLeuSerArgGluGlyProAla GluGlylleAlaGluAspSerIleAspSerIleIleValAlaAlaSerGl Sequence 2990 BP; 758 A; 655 C; 801 G; 776 T; 0 other; Identity: 79.471 Length: Gaps: : : Claim 1; Column 25-28; 29pp; English Percent from: 1 Ouality: 2651.00 Ratio: 4.587 Percent Similarity: 89.891 to: AAV66832 alignment\_block: US-09-674-824-2 x AAV66832 alignment\_scores Align seg 1/1

The sequence is that of the starch synthase coiding region from PEXS2. It can be used in the production of a hybrid polypeptide comprising a starch-encapsulating region (SER) fused to a payload protein. The hybrid polypeptide can be used to make modified starches comprising the payload protein, selected from, immunoglobulins, etc. The modified starch can also be used to provide grain feeds enriched in amino acids. By encapsulating degradation by stomach acids.

The present sequence is the corn soluble starch synthase (SSI) DNA sequence Inserted into plasmid pSS42. Chimeric gene of pSS42 was cloned into the vector pKSI7 for the generation of an antisense construct for suppression of SSI expression in corn. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin ratio, amylopectin fine structure, increased abundance of very short amylopectin chains and in the degree of polymerisation of amylose. These modifications can be created by controlling the expression of non-GBSSI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in
 Producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct
 Soluble starch synthase; starch fine structure; corn; transgenic plant; amylose; amylopectin; amylose polymerisation; non-granule bound starch synthase; non-GBSSI; altered starch; fpaper; plastic; adhesive; ss.

The invention relates to a novel enzyme of starch blosynthetic pathway in a cereal plant, where the enzyme is selected from starch branching enzyme (BBE) I. StBE II. starch soluble synthase (SSS) I. and debranching enzyme (BBE), with the proviso that the enzyme is not SSS I of rice, or SBE I of rice or maize. The methods and products can be used for targeting expression specifically to the endosperm of the seeds of cereal plants such as wheat or barley. They can be used for the expression of e.g. antisense sequences of granule-bound synthase (GBSS), SBE II, low mol. wt. glutenin, grain softness protein I. bacterial isommylase, and wheat high mol. wt. glutenin Bx17. They can be used for modifying the characteristics of starch produced by a plant. The present sequence represents the wheat SSS I gene sequence.
 New isolated cereal plant enzyme genes used for, e.g. expression of antisense sequences of granule bound synthase

The present sequence is the corn soluble starch synthase (SSI) DNA sequence comprising the SSI coding region of amino acids 1-494 inserted into plasmid ps564-C5. The chimeric gene containing the zein promoter followed by the SSI gene fragment is used as a sense construct for preparation of transgenic corn expressing altered starch structure. The starch fine structure derived from a grain of the cereal crop can be altered in the transformed cereal crop by changes in amylose to amylopectin from a grain of the dease debundance of wery short amylopectin fine structure, increased abundance of very short amylopectin fine because of polymerisation of expression of non-GBSISI (non-granule bound starch synthase) in transgenic plants. Altered starches are useful in foods, paper, plastics producing transgenic cereal crops with altered starch structure useful for preparing foodstuff, paper, plastic or adhesives, comprises transforming crops with chimeric sense or antisense gene construct encoding starch synthase Soluble starch synthase; starch fine structure; corn; transgenic plant; amylose; amylopectin; amylose polymerisation; non-granule bound starch synthase; non-GBSSI; altered starch; food; paper; plastic; adhesive; ss. ADPQUICOSE--Starch glucosyltransferase (EC 2.4.1.21) precursor - maize
ADPQUICOSE--starch glucosyltransferase (EC 2.4.1.21) precursor - maize
ADPQUICOSE--starch glucosyltransferase I
C; Species: Zea mays (maize)
C; Species: Zea mays (maize)
C; Date: 12-Feb-1999 #text_change il-Jan-2000
C; Accession: T01414
R; Knight, M.E.; Harn, C.; Lilley, C.E.R.; Guan, H.P.; Singletary, G.W.; Mu:Forester,
Plant J. 14, 613-622, 1998
A; Title: Molecular cloning of starch synthase I from maize (W64A) endosperm and expre
A; Reference number: Z14279; MUID:98340555
A; Reference number: Z14279; MUID:98340555
A; Reference number: Local can and expre
A; Reference number: Local can and can and can and can and can also a starch and a constant and can also a constant
 A; Description: catalyzes the alpha-1,4-glucosylation of starch by ADPglucose producin C; Superfamily: starch synthase C; Keywords: glycogen/starch biosynthesis; glycosyltransferase; hexosyltransferase

A;Description: catalyzes the alpha-1,4-glucosylation of starch by UDPglucose producin C;Superfamily: starch synthase C;Keywords: chioroplast; glycogen/starch biosynthesis; glycosyltransferase; hexosyltr
 A;Introns: 114/1; 141/1; 174/1; 204/1; 225/2; 259/1; 295/3; 377/1; 436/1; 500/1; 529/
C;Function:
 Uppglucose-starch glucosyltransferase (EC 2.4.1.11) - rice
Uppglucose-starch glucosyltransferase (EC 2.4.1.11) - rice
Uppglucose-starch glucosyltransferase (EC 2.4.1.11) - rice
Uppglucose-starch granule-bound starch synthase

and yellow anther were collected and total RNA, and
poly(A) RNA were prepared, a CDNA library was made, and
the CDNA clones were in vivo excised to give pBluescript
phagemids in the TJ Close lab (Choi, Close, Fenton) at
the University of California, Riverside. Plasmid DNA
preparations and DNA sequencing were performed in the OD
Anderson lab (all other authors)."

XhOI; This cDNA library was constructed from mRNA isolated
from cotyledons of 3- and 7-day-old Williams seedlings
which were propagated on paper towels with distilled
water. The cotyledons were flash-frozen in liquid
nitrogen, then lyophilized for 72 hours. Unequal amounts
of mRNA was used for cDNA synthesis. Stratagene's cDNA
Synthexix Kit (catalog number 200401) was used to
synthesize the cDNA. First- stranded synthesis was
performed with 5-methyl dCTP, hence the ligated cDNA was
hemimethylated. A modification of Stratagene's
first-strand synthesis primer was used. An anchor
nucleotide (V+A, C, or G) was added to the 3' end of the
primer [GACAGAGAGAGAGAGAACTAGTCTCGAG(T)18] to anchor
the primer at the 5' end of the poly(A) tract
second- strand synthesis, the cDNA ends were filled in
with cloned Pfu DNA, ligated to EcoRI adapters and
subsequently phosphorylated. The XhOI site within the

first-strand synthesis primer was then restricted by digestion with XhoI; all XhoI sites in the CDNA would be protected by their hemimethylated status. The CDNA constructs were size-fractionated with a 500 bp cutoff, using GibcoBRL Life Technologies' CDNA Size Fractionation column. The column eluent was then ligated into Stratagene's plausacript(Lm) II XR Predigested vector (pBluescript II SK(+) that has been digested with EcoRI and XhoI, and phosphorylated by Stratagene). 97% of the white and blue colonies appear to contain recombinant plasmids with cDNA inserts, based on size (n=30). This library was constructed by Dr. Paul Keim and Dr. Virginia Coryell.

 /lab_nost="upuble"
//note="vector: pBluescript SK-: Site_1: ECORI; Site_2:
xhoI; Construction of the cDNA library was carried out
using Stratagenes 'UnizaP - cDNA synthesis kit'. cDNA was
constructed using an oligo dT primer/linker that contains
a xhoI site within it. Pollowing ds cDNA synthesis,
ECORI adapters were ligated to the blunt ends and sample
was digested with XhoI. The result is cDNA with an ECORI
sticky end on one side and a XhoI sticky end on the other.
This cDNA was ligated directionally in OnizAP arms. The
vector is designed containing the pBluescript sequence as
well as lambda DNA and cDNA is cloned within this
pBluescript sequence. The vector was then packaged using
Gold gigapackaging extracts. Library was grown in XIIBlue
MRF' cells and amplified. The library was grown is XIIBlue
axasist as a helper phage that releases the pBluescript
sequence and circularises it as single stranded plasmids
that are then packaged (by helper phage) and secreted out
of the host cell as phagemids. SOUR cells were transformed
with phagemids and the library was plated out on LB-amp
plates to select for transformants. Approximately 1,000
/000 colonies were grown and recovered. The double
stranded plasmid library was recovered by using Quiagen
Midi prep kit. 2 micro grams of each library were used to
